1. I did not watch many march madness tournaments when I was younger, nor do I remember many of them, but I was shocked to learn how dominating the higher seeds were back then. I love that my bar plot helps show the change in the spread of wins by seeds as the season get closer to present day.
2. I decided I wanted some cool colors and lots of colors to pop so I wanted a mostly black canvas allowing any colors I chose to pop. I also really enjoy the look of black and white and thought it made everything else look a little cleaner. I had to change some of the names in the dataset because I was running into an error when I ran the shiny app that it couldn't find the element, I also filtered out the year 2020 because there was no tournament that year.
3. I use the inputs from the user to determine the variables for my scatterplot which then gets created and shown when the update plot button is pressed my bar plot also relies on the user to select which season they would like to see.
